Privacy and security note

Project Udyam Digital · Airtel SYNC 2026 · Track A

This prototype uses only the fictional challenge dataset and specimen documents. It does not contact GST, Udyam, DigiLocker, e-sign, Airtel, or any other external service.

Consent and purpose

Before the KYC demonstration, the user sees a purpose-specific consent checkbox. Details are used only to illustrate document and registry checks in this prototype. Mock lookups compare against the supplied synthetic registries and do not establish the identity or status of a real business.

Data minimisation and retention

The demo asks only for the details needed for the selected journey. Identifiers are masked in results. Uploaded files stay in active Streamlit session memory; the application does not write them to disk or a database. Closing or restarting the app clears the demo session. No production customer records are included.

Validation and human review

OCR values are fixture-backed simulations, not actual OCR. A missing, inactive, or mismatched value is flagged for manual review; the prototype never claims automatic approval. Government registry integrations are mocked and local.

Production safeguards

A production service would require an approved retention period, access controls, encryption in transit and at rest, masked audit logs, a deletion workflow, and authorised registry integrations. Processing should follow applicable Indian privacy requirements, including the DPDP Act, 2023, with review by privacy and security teams.

All people, businesses, identifiers and documents shown in the prototype are fictional challenge specimens.
